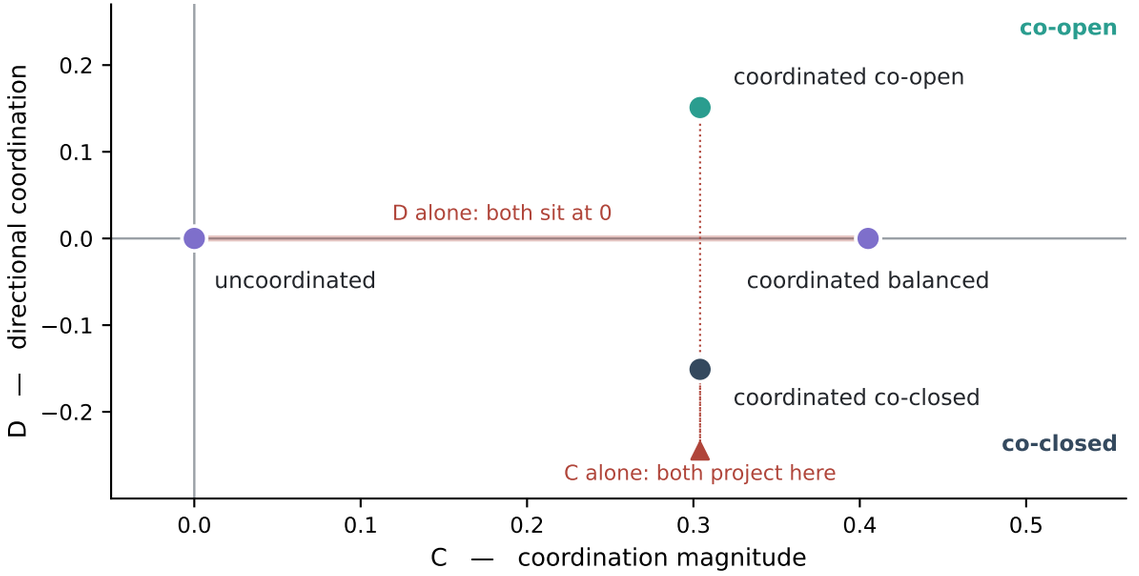
a the same four scenarios, as co-state mass

b neither axis is sufficient alone



C answers "how strongly coordinated?"

Blind to direction by construction: Cov is unchanged by open ↔ closed, so co-open and co-closed score identically.

D answers "coordinated which way?"

Signs C by where the concordant mass sits, F. Collapses to 0 when there is nothing to sign — and also when F ≈ 0.5.

Report both.

D ≈ 0 is ambiguous alone: with C ≈ 0 it means mixed, with C large it means coordinated but balanced. Only the pair separates them.
